INDOOR ENVIRONMENTAL QUALITY AND MOLD ASSESSMENT LONG GROVE, ILLINOIS

SUMMARY

An Indoor Environmental Quality (IEQ) and mold assessment was conducted on March 27, April 18, and May 1, 2023, at Woodlawn Middle School and Country Meadows Elementary School. Both schools are in the same building located at 6362 and 6360 Gilmer Road in Long Grove, Illinois. The assessment consisted of room-by-room visual inspection of the building, including inside ventilation systems, measurements for common IEQ parameters, and collection of samples for airborne mold spores.

The visual assessment was performed on March 27, 2023. This was done over spring break to allow for thorough inspection of rooms and ventilation systems without class disruption. IEQ measurements and sampling for airborne mold spores was performed on April 18 and May 1, 2023. These days were selected to evaluate conditions on school days, with normal occupancy and classroom activity. The protocol was repeated on two days to account for potential variability and verify that results are reproducible.

Visual Assessment

The building, and ventilation systems, appeared very clean and well maintained. There were no indications of moisture problems or mold growth to the extent that indoor air quality (IAQ) would be affected. Most walls were concrete masonry unit construction and flooring in corridors and common areas were non-porous surfaces, these building materials generally do not support mold growth. Carpeting, wallboard, ceilings, and other porous materials were found to be clean and in good condition.

There was no apparent water damage inside accessible areas of ventilation systems. Outdoor air intakes were through gables located on the roof and were clean, unobstructed, and away from contaminant sources. Air filters were in place and in good condition. A mechanical contractor was on-site at the time of the inspection. The contractor was performing routine cleaning and maintenance of ventilation systems, which is normally done over spring break.

Small areas of mold growth were observed in two locations. Combined, these areas were less than approximately 3 square feet of mold growth across the two schools. For context, the United States Environmental Protection Agency (USEPA) defines a mold growth of less than 10 square feet in a given area as "small".¹ The two areas are described as follows:

- A few square inches of mold was observed in a cabinet under a science lab sink in room 710. The cabinet was dry, indicating that this was likely caused by a past leak from the sink which had since been repaired.
- There were a couple square feet of mold growth on the drywall ceiling in the Fire Panel Room/Electrical Room. This room is locked and not accessible to students. The ceiling was dry at the time of the assessment. It was reported that this was caused by water damage from a backed-up gutter that had been repaired.

Airborne Mold Samples

Indoor samples were collected on each day of the assessment from 23 rooms, for a total of 46 samples. An additional 8 samples were collected outdoors to allow for comparison between indoor and outdoor mold concentrations and types. Rooms were selected to include at least one location from each ventilation zone.

¹ USEPA Mold Remediation in Schools and Commercial Buildings, document EPA-402-K-01-001, 2008.

INDOOR ENVIRONMENTAL QUALITY AND MOLD ASSESSMENT LONG GROVE, ILLINOIS

Airborne mold concentrations were lower inside the building than outdoors at all locations and the array of mold types was similar in indoor and outdoor air. Indoor airborne mold spore concentrations ranged from less than 20 to 480 spores per cubic meter of air (spores/m³) with an average indoor concentration of 126 spores/m³² while outdoor concentrations were between 240 and 4,800 spores/m³ with an average outdoor concentration of 1,130 spores/m³. Results were consistent across both days of sampling, demonstrating reproducibility.

These results support the observations made in the visual assessment that mold growth is not a concern in these schools.

IEQ Measurements

IEQ parameters included carbon monoxide (CO), carbon dioxide (CO₂), temperature, and relative humidity (RH).

- CO₂ is a by-product of human respiration and measurements are made to estimate if the amount of outdoor air being brought into classrooms is sufficient for the number of room occupants. In general, CO₂ levels should be less than approximately 700 parts per million (ppm) above outdoors, or 1,150 ppm. Results were within this guideline for all but classrooms 612, 812 and 816. These rooms had concentrations slightly above guidelines. This is not a health risk but indicates that the amount of outdoor air brought in through ventilation systems could be increased.
- CO was not detected in the schools.
- Temperatures ranged from 69 degrees Fahrenheit (°F) to 75°F across both schools. These were within recommended comfort guidelines.
- RH ranged the low 20 percent (%) to mid-30%. RH was typically within the lower range of recommended levels. This is not unusual for the climate in Northern Illinois during the late winter/early spring, when the buildings are being heated. Increasing RH would require supplemental humidification which can result in condensation and microbial growth in buildings and is generally not recommended for this type of school building.

² Worse case calculation by assuming results below the limit of quantification were at the limit of quantification (i.e., <20 = 20).

INDOOR ENVIRONMENTAL QUALITY AND MOLD ASSESSMENT LONG GROVE, ILLINOIS

1. INTRODUCTION

An IEQ and mold assessment was conducted on March 27, April 18, and May 1, 2023, at Woodlawn Middle School and Country Meadows Elementary School. Both schools are in the same building located at 6362 and 6360 Gilmer Road in Long Grove, Illinois. The assessment consisted of room-by-room visual inspection of the building, including inside ventilation systems, measurements for common IEQ parameters, and collection of samples for airborne mold spores.

Project oversight and management was provided by Robert Rottersman, MS, CIH Principal with Ramboll Americas Engineering Solutions, Inc. (Ramboll)³. The on-site assessment was completed by Mr. Rottersman and Scott Fountain, Managing Consultant with Ramboll.

The visual assessment was performed on March 27, 2023. This was done over spring break to allow for thorough inspection of rooms and ventilation systems without class disruption. IEQ measurements and sampling for airborne mold spores was performed on April 18 and May 1, 2023. These days were selected to evaluate conditions on school days, with normal occupancy and classroom activity. The protocol was repeated on two days to account for potential variability and verify that results are reproducible.

This report is representative of observations, conditions, test data, and information obtained on the days of the assessment.

Results tables are included in Appendix A, methodology can be found in Appendix B, laboratory reports are included in Appendix C, and certificates of calibration are in Appendix D.

2. RESULTS

Results are presented and discussed below. Laboratory reports are included in Appendix C.

2.1 Visual Assessment

The assessment included a room-by-room inspection of the schools. This included classrooms, offices, cafeteria, gymnasiums, locker rooms, mechanical rooms, storage areas, etc. A limited inspection of the attic areas was also included. The inspection focused on areas that would be most likely to sustain water damage that could result in mold growth such as exterior walls, ceilings, walls with plumbing chases, below sinks, etc.

Observations found the building to be clean, well maintained, and low risk for mold growth or other conditions that could adversely affect air quality in the building.

Small amounts of mold growth were observed in two locations. These were both minor conditions that would not be expected to affect air quality in the building. The identification of only two small areas in a large school building indicated a very well-maintained school. Most schools of this size that Ramboll has inspected contain some areas of mold growth, often more numerous and larger in size than observed in Woodlawn and Country Meadows schools. These areas are described as follows:

- A few square inches of mold was observed in a cabinet under a science lab sink in room 710. The cabinet was dry, indicating that this was likely caused by a past leak from the sink which had since been repaired.

³ As of September 1, 2023 Ramboll US Consulting, Inc. is now Ramboll Americas Engineering Solutions, Inc.

INDOOR ENVIRONMENTAL QUALITY AND MOLD ASSESSMENT LONG GROVE, ILLINOIS

- There were a couple square feet of mold growth on the drywall ceiling in the Fire Panel Room/Electrical Room. This room is locked and not accessible to students. The ceiling was dry at the time of the assessment. It was reported that this was caused by water damage from a backed-up gutter that had been repaired.

These were both minor conditions that would not be expected to affect air quality in the building. The identification of only two small areas in a large school building indicated a very well-maintained school.

Photo 1 - Below a sink in room 710, during the assessment.

Photo 2 - Below sink in room 710, after repair and cleaning

Photo 3 - Water damaged ceiling in the Fire Panel/Electrical room during the assessment.

Photo 4 - Damaged ceiling in the Fire Panel/Electrical room removed and replaced.

Ramboll notified the school's facility maintenance staff and affected materials in both areas were removed and surrounding surfaces were cleaned.

Most interior and exterior walls of the schools were concrete masonry unit (CMU) construction. This inorganic building material will not typically support mold growth. Drywall was used in some locations as interior partition walls. Inspection of drywall walls did not identify signs of water damage or mold growth.

In most of the school the ceiling consisted of lay-in tiles in a grid. The ceiling tiles were found to be clean and in good condition. There were a few locations with small water stains on ceiling tiles, mold was not apparent. These tiles were reportedly replaced at the time of the assessment.

Floor surfaces appeared relatively new, clean and in good condition. Floors in corridors and common areas were non-porous surfaces which would not be expected to support mold growth. Carpeting in classrooms and offices appeared clean with no obvious signs of water damage.

Representative areas of the attic were inspected and found to be clean with no obvious evidence of water damage including leaks or condensation.

INDOOR ENVIRONMENTAL QUALITY AND MOLD ASSESSMENT LONG GROVE, ILLINOIS

2.2 Ventilation Systems

Ventilation to the building is provided by ten (10) air handling units (AHUs) located in mechanical penthouses throughout the schools. It was reported that preventative maintenance, including filter changes, are performed over winter, spring, and summer breaks by third party mechanical contractor. The contractor was on-site at the time of Ramboll's inspection and were observed changing filters, performing maintenance, and performed spot cleaning of dust accumulations in the systems. The ventilation system is controlled by a Building Automation System (BAS).

Ramboll inspected accessible components of the ventilation systems most likely to affect indoor air quality or support mold growth. These included outdoor air intakes, filters, cooling coils, condensate drain pans, internal insulation, etc.

The AHUs were found to be in good condition with no apparent evidence of moisture damage or mold growth. Air filters were new and fit securely in their frames.

Outdoor air intakes were located on roof gables and appeared clean and unobstructed. The position of the intakes, on the roof, were away from contaminant sources and therefore are less likely to have accumulation of organic debris, such as leaves and grass clippings, as compared to ground level intakes that are common in many other school buildings.

2.3 Airborne Mold Sampling

A summary of airborne mold spore results and the respective sample locations is presented in Table I in Appendix A. Laboratory reports are included in Appendix C.

Mold is ubiquitous in the outdoor environment and produces spores as part of its reproductive cycle; these spores are commonly found airborne in both outdoor and indoor air. Due to ventilation system filtration and the fact that indoor conditions in general do not support mold growth, indoor mold spore counts are typically lower than outdoor counts. However, if sufficient moisture is present, mold can proliferate within a building as the nutrients for its growth are readily available. Currently levels of mold spores are not covered by any regulatory standard. Interpretation of results is typically done by comparing indoor to outdoor concentrations and distribution of mold types as well as comparing indoor locations to each other.

Indoor samples were collected on each day of the assessment from 23 rooms, for a total of 46 samples. An additional 8 samples were collected outdoors, four on each day of testing, to allow for comparison between indoor and outdoor mold concentrations and types. Rooms were selected to include at least one location from each ventilation zone.

Airborne mold concentrations were lower inside the building than outdoors at all locations and the array of mold types was similar in indoor and outdoor air. Indoor airborne mold spore concentrations ranged from less than 20 to 480 spores/m³ with an average indoor concentration of 126 spores/m³⁴ while outdoor concentrations were between 240 and 4,800 spores/m³ with an average outdoor concentration of 1,130 spores/m³. These results support the observations made in the visual assessment that mold growth is not a concern in these schools.

2.4 Air Quality Measurements

A summary of air quality measurements and the respective sample locations are presented in Table II in Appendix A.

2.4.1 Temperature & Relative Humidity (RH)

Temperature and RH are physical conditions which can affect perceptions of indoor air quality by affecting human comfort. Temperature and RH measurements were measured throughout the school on April 18 and May 1, 2023.

⁴ Worse case calculation by assuming results below the limit of quantification were at the limit of quantification (i.e., <20 = 20).

INDOOR ENVIRONMENTAL QUALITY AND MOLD ASSESSMENT LONG GROVE, ILLINOIS

Temperatures ranged from 69 °F to 75°F across both schools. These were within recommended comfort guidelines set by the American Society of Heating, Refrigeration, and Air Conditioning (ASHRAE).

RH ranged the low 20% to mid-30%. RH was typically within the lower range of recommended levels. This is not unusual for the climate in Northern Illinois during the late winter/early spring, when the buildings are being heated. Increasing RH would require supplemental humidification which can result in condensation and microbial growth in buildings and is generally not recommended for this type of school building.

2.4.2 Carbon Dioxide (CO₂)

CO₂ is an odorless, nontoxic gas present in the outdoor air in concentrations usually ranging from 300 to 500 ppm. The primary source of CO₂ in the indoor environment is human respiration. CO₂ concentrations in the indoor air are usually diluted by the introduction of outside air through the ventilation system. During this survey, CO₂ concentrations were measured to estimate if the amount of outside air entering the rooms was sufficient for the population.

Measurements for CO₂ were taken outdoors for comparison to the recommended guideline of maintaining indoor levels within 700 ppm of outdoor levels. CO₂ outdoors measured around 436-473 ppm; therefore 1,150 ppm is used as a guideline.

Results are included in Table II in Appendix A. Results were within this guideline for all but classrooms 612, 812, and 816. These rooms had concentrations slightly above the recommended guidelines. This is not a health risk but indicates that the amount of outdoor air brought in through ventilation systems could be increased.

2.4.3 Carbon Monoxide (CO)

CO is an odorless gas and a chemical asphyxiant produced as a result of incomplete combustion. Exhausts from gas powered vehicles and/or malfunctioning gas or oil-fired heaters are common sources of CO in indoor environments.

CO was not detected inside the school or outdoors.

INDOOR ENVIRONMENTAL QUALITY AND MOLD ASSESSMENT LONG GROVE, ILLINOIS

3. CONCLUSIONS AND RECOMMENDATIONS

IEQ in Woodlawn Middle School and Country Meadows Elementary School was found to be very good. Building materials, surfaces and ventilation systems were in good condition and well maintained. The number, and extent, of findings identified for follow-up action were much less than Ramboll typically encounters when performing similar assessments in other school buildings.

The following recommendations are offered for consideration. They are intended to promote good environmental quality within the facility. Implementation of these recommendations is not required by any regulatory agency but would be considered good practice. They should not be construed as the only options available or inclusive of all potential environmental quality parameters within the facility.

Recommendations are as follows:

- Remove mold contaminated material from the cabinet under the sink in Classroom 710 and the ceiling in the Fire Panel/Electrical Room. Both areas should be addressed following the Environmental Protection Agency (EPA) guidelines for "small" areas, less than 10 square feet of affected material. These repairs have been completed.
- Consider adjusting the outdoor air dampers to increase the amount of outdoor air brought in through the ventilation systems when classrooms are at full occupancy.

Results of this survey are based on conditions present on the days of the assessment.

Please contact our office if you have any questions regarding the above report. Ramboll thanks you for the opportunity to be of service.

Sincerely,

Ramboll Americas Engineering Solutions, Inc.

**INDOOR ENVIRONMENTAL QUALITY AND MOLD ASSESSMENT
LONG GROVE, ILLINOIS**

**APPENDIX B
METHODOLOGY, STANDARDS, & GUIDELINES**

INDOOR ENVIRONMENTAL QUALITY AND MOLD ASSESSMENT LONG GROVE, ILLINOIS

METHODOLOGY

The survey included a visual inspection of each room in both schools, as well as measurements of comfort parameters including temperature, RH, CO, and CO₂ in both areas. The collection of air samples for potential mold contamination was used as a tool to assess the potential for hidden indoor mold growth.

Airborne Mold Sampling

Tests for airborne mold spores were performed to supplement the visual inspection component of the assessment. Currently, there are no reputable established standards or recommendations for acceptable levels of airborne mold spores. In lieu of any established guidelines, results are typically compared to outdoor concentrations. Results with abnormal levels (e.g., higher concentrations inside the building vs. outside) or distribution of mold types that are different than those observed outside the building may indicate the possibility of a concealed indoor growth source and the need for a more detailed inspection of the area to identify the source. When mold is not visually apparent and there is no evidence of water intrusion (such as water stains, bubbling paint, efflorescence, etc.) sample results with normal concentrations and species distribution can provide additional confidence that mold growth is not a concern in the test areas.

Mold sampling was conducted using a Burkard air sampling device, which is a slit, spore trap, impactor. The Burkard uses a pre-greased microscope slide that is inserted into the Burkard and turned on for a pre-determined period of time (typically between 3 and 7 minutes) at a flow rate of 10 liters of air per minute (lpm). The slides are removed, placed in a plastic holding case, and sent to the laboratory for analysis. Samples were analyzed by light microscopy to provide a count and classification for fungal components trapped on the slide.

Sample analysis was performed via light microscopy by Eurofins EMLab in Marlton, NJ which is accredited by the American Industrial Hygiene Association (AIHA) through the Environmental Microbiology Laboratory Accreditation Program (EMLAP).

Carbon Dioxide (CO₂)

CO₂ is a by-product of human respiration (exhaled air). Measurements of CO₂ concentrations within a building are often used as a surrogate for determining the adequacy of outside air ventilation provided to the space. Measurements for CO₂ were taken at the same times and locations as the airborne mold spore samples were taken. All measurements were made with a TSI Q-Trak, Model 8551.

Temperature & Relative Humidity

Temperature and RH are comfort parameters which are important to the perception of air quality. Temperature and RH readings were obtained at the same locations and times as CO₂ measurements as described above. All measurements were made with a TSI Q-Trak, Model 8551.

Carbon Monoxide (CO)

CO is a contaminant gas which may enter an indoor environment from vehicle exhaust gas infiltration, cracked furnace heat exchangers, cross contamination from exhaust stacks, etc. Excess exposure can cause nausea, shortness of breath, and headaches. Tests for CO were conducted at the same locations and times as the occupant comfort parameters using the TSI Q-Trak, Model 8551.

**INDOOR ENVIRONMENTAL QUALITY AND MOLD ASSESSMENT
LONG GROVE, ILLINOIS**

**APPENDIX C
LABORATORY REPORTS AND CHAIN OF CUSTODY**

Report for:

Mr. Scott Fountain
Ramboll US Corporation: Illinois
333 W. Wacker Drive, Suite 2700
Chicago, IL 60606

Regarding: Eurofins EPK Built Environment Testing, LLC
Project: 16900; Spore Trap
EML ID: 3235496

Approved by:

Dates of Analysis:

Spore trap analysis: 04-20-2023 and 04-21-2023

Technical Manager
Ariunaa Jalsrai

Service SOPs: Spore trap analysis (EM-MY-S-1038)
AIHA-LAP, LLC accredited service, Lab ID #103005

All samples were received in acceptable condition unless noted in the Report Comments portion in the body of the report. Due to the nature of the analyses performed, field blank correction of results is not applied. The results relate only to the samples as received and tested. Information supplied by the client which can affect the validity of results: sample air volume.

Eurofins EPK Built Environment Testing, LLC ("the Company"), a member of the Eurofins Built Environment Testing group of companies, shall have no liability to the client or the client's customer with respect to decisions or recommendations made, actions taken or courses of conduct implemented by either the client or the client's customer as a result of or based upon the Test Results. In no event shall the Company be liable to the client with respect to the Test Results except for the Company's own willful misconduct or gross negligence nor shall the Company be liable for incidental or consequential damages or lost profits or revenues to the fullest extent such liability may be disclaimed by law, even if the Company has been advised of the possibility of such damages, lost profits or lost revenues. In no event shall the Company's liability with respect to the Test Results exceed the amount paid to the Company by the client therefor.

Eurofins EPK Built Environment Testing, LLC's LabServe® reporting system includes automated fail-safes to ensure that all AIHA-LAP, LLC quality requirements are met and notifications are added to reports when any quality steps remain pending.

Smuts, Periconia, Myxomycetes						
Stachybotrys						
Stemphylium						
Torula						
Ulocladium						
Zygomycetes						
Background debris (1-4+)††	1+			1+		
Hyphal fragments/m3	20			< 20		
Pollen/m3	20			< 20		
Skin cells (1-4+)	< 1+			1+		
Sample volume (liters)	50			50		
§ TOTAL SPORES/m3			640			160

Comments:

Spore types listed without a count or data entry were not detected during the course of the analysis for the respective sample, indicating a raw count of <1 spore.

† The spores of *Aspergillus* and *Penicillium* (and others such as *Acremonium*, *Paecilomyces*) are small and round with very few distinguishing characteristics. They cannot be differentiated by non-viable sampling methods. Also, some species with very small spores are easily missed, and may be undercounted.

††Background debris indicates the amount of non-biological particulate matter present on the trace (dust in the air) and the resulting visibility for the analyst. It is rated from 1+ (low) to 4+ (high). Counts from areas with 4+ background debris should be regarded as minimal counts and may be higher than reported. It is important to account for samples volumes when evaluating dust levels.

The analytical sensitivity is the spores/m³ divided by the raw count, expressed in spores/m³, per spore and per sample.

For more information regarding analytical sensitivity, please contact QA by calling the laboratory.

‡ A "Version" indicated by -"x" after the Lab ID# with a value greater than 1 indicates a sample with amended data. The revision number is reflected by the value of "x".

§ Total Spores/m³ has been rounded to two significant figures to reflect analytical precision.

They cannot be differentiated by non-viable sampling methods. Also, some species with very small spores are easily missed, and may be undercounted.

††Background debris indicates the amount of non-biological particulate matter present on the trace (dust in the air) and the resulting visibility for the analyst. It is rated from 1+ (low) to 4+ (high). Counts from areas with 4+ background debris should be regarded as minimal counts and may be higher than reported. It is important to account for samples volumes when evaluating dust levels.

The analytical sensitivity is the spores/m³ divided by the raw count, expressed in spores/m³, per spore and per sample.

For more information regarding analytical sensitivity, please contact QA by calling the laboratory.

‡ A "Version" indicated by -"x" after the Lab ID# with a value greater than 1 indicates a sample with amended data. The revision number is reflected by the value of "x".

§ Total Spores/m³ has been rounded to two significant figures to reflect analytical precision.

¹EMLab Regional Climate codes are a climate classification scheme for regional geographic areas containing multiple states. The MoldRANGE™ Local Climate report uses the sampling location zip code to identify the EMLab Regional Climate code in that area. Using information available from the NOAA weather database, the EMLab Regional Climate code sharpens the precision of the MoldRANGE™ reporting system, providing more reliable estimates of the range and average concentrations of the different airborne fungal spore types for each region. Additional information on the EMLab Regional Climate code system can be found on the last page of this report.

†The Typical Outdoor Data represents the typical outdoor spore levels across the region's group of states for the time period and EMLab Regional Climate code indicated. The last column represents the frequency of occurrence. The very low, low, med, high, and very high values represent the 10, 20, 50, 80, and 90 percentile values of the spore type when it is detected. For example, if the frequency of occurrence is 63% and the low value is 53, it would mean that the given spore type is detected 63% of the time and, when detected, 20% of the time it is present in levels above the detection limit and below 53 spores/m3. These values are updated periodically and if not enough data is available to make a statistically meaningful assessment, it is indicated with a dash.

‡ n is the sample size used to calculate the MoldRANGE™ Local Climate data summarized in the table.

* The spores in this category are generally capable of growing on wet building materials in addition to growing outdoors. Building related growth is dependent upon the fungal type, moisture level, type of material, and other factors. *Cladosporium* is one of the predominant spore types worldwide and is frequently present in high numbers. *Penicillium/Aspergillus* species colonize both outdoor and indoor wet surfaces rapidly and are very easily dispersed. Other genera are usually present in lesser numbers.

** These fungi are generally not found growing on wet building materials. For example, the rusts and smuts are obligate plant pathogens. However, in each group there are notable exceptions. For example, agents of wood decay are members of the basidiomycetes and high counts of a single morphological type of basidiospore on an inside sample should be considered significant.

§ Total Spores/m3 has been rounded to two significant figures to reflect analytical precision.

§ TOTAL SPORES/m3	240												

¹EMLab Regional Climate codes are a climate classification scheme for regional geographic areas containing multiple states. The MoldRANGE™ Local Climate report uses the sampling location zip code to identify the EMLab Regional Climate code in that area. Using information available from the NOAA weather database, the EMLab Regional Climate code sharpens the precision of the MoldRANGE™ reporting system, providing more reliable estimates of the range and average concentrations of the different airborne fungal spore types for each region. Additional information on the EMLab Regional Climate code system can be found on the last page of this report.

†The Typical Outdoor Data represents the typical outdoor spore levels across the region's group of states for the time period and EMLab Regional Climate code indicated. The last column represents the frequency of occurrence. The very low, low, med, high, and very high values represent the 10, 20, 50, 80, and 90 percentile values of the spore type when it is detected. For example, if the frequency of occurrence is 63% and the low value is 53, it would mean that the given spore type is detected 63% of the time and, when detected, 20% of the time it is present in levels above the detection limit and below 53 spores/m3. These values are updated periodically and if not enough data is available to make a statistically meaningful assessment, it is indicated with a dash.

‡ n is the sample size used to calculate the MoldRANGE™ Local Climate data summarized in the table.

* The spores in this category are generally capable of growing on wet building materials in addition to growing outdoors. Building related growth is dependent upon the fungal type, moisture level, type of material, and other factors. *Cladosporium* is one of the predominant spore types worldwide and is frequently present in high numbers. *Penicillium/Aspergillus* species colonize both outdoor and indoor wet surfaces rapidly and are very easily dispersed. Other genera are usually present in lesser numbers.

** These fungi are generally not found growing on wet building materials. For example, the rusts and smuts are obligate plant pathogens. However, in each group there are notable exceptions. For example, agents of wood decay are members of the basidiomycetes and high counts of a single morphological type of basidiospore on an inside sample should be considered significant.

§ Total Spores/m3 has been rounded to two significant figures to reflect analytical precision.

Understanding EMLab Regional Climate Codes

Outdoor airborne spore concentrations are strongly influenced by climate and weather patterns, often resulting in pronounced seasonal and diurnal cycles (Burge 1995). The seasonal climatic changes directly affect the growth cycle of plants, thereby influencing fungal growth, spore maturation, and release cycles. By evaluating outdoor spore concentrations across similar climatic zones rather than for the state as a whole, it is possible to provide a more representative estimate of typical outdoor spore levels and frequency of occurrence for different airborne fungal spore types in a given area.

The EMLab Regional Climate code system is a novel classification system that uses data from the NOAA - National Oceanic and Atmospheric Administration database to define unique climate zones. The following climate variables, for each regional zip code, are obtained from NOAA and assigned a letter code of A (above the regional average for that variable) or B (below the regional average for that variable):

1. Annual High Temperature
2. Elevation
3. Rainfall/Precipitation
4. Monthly Temperature Range

The result is a 4-character code assigned to each statewide zip code, referred to as the Regional Climate Code. Below are some examples of decoded Regional Climate Codes:

AAAA = Above avg. Annual High Temperature, Above avg. Elevation, Above avg. Rainfall/Precipitation, Above avg. Monthly Temperature Range
AABB = Above avg. Annual High Temperature, Above avg. Elevation, Below avg. Rainfall/Precipitation, Below avg. Monthly Temperature Range
BBA A = Below avg. Annual High Temperature, Below avg. Elevation, Above avg. Rainfall/Precipitation, Above avg. Monthly Temperature Range

The actual outdoor air sample data from matching regional climate codes in each group of states are then compiled in a manner relating typical spore concentrations and frequency of occurrence.

The data presented in this report is from the Central Region which includes the states of: IL, IN, KY, MO, OH, TN, and WV

The NOAA regional climate variables were selected by mapping data points from a subset of approximately 145,000 weather and geographic database entries to over 80,000 outdoor spore trap samples with known zip codes and assessing them using orthogonal array experimental design techniques. The results were then compared to the typical ranges of spore types found when grouping zip codes using the Koppen-Geiger climatic classification system; a commonly used climatic system that provides an objective numerical definition in terms of climatic elements such as temperature, rainfall, and other seasonal characteristics. The EMLab Regional Climate codes showed improved granularity and refinement of the zip code groupings, implying a better representation of the expected range of spore types to be found within an individual zip code.

The values on this report were calculated by obtaining the four variables listed above from the over 585 million data points of weather and geographic information available in the NOAA database, and determining the frequencies and percentile values of spore types by utilizing over 180,000 Eurofins EMLab P&K outdoor spore trap samples with known zip codes.

This report groups regional zip codes in relation to these EMLab Regional Climate codes and summarizes MoldRANGE™ data by month and year within each EMLab Regional Climate code.

About Your New MoldRANGE Local Climate Report:

Why am I receiving this report?

The MoldRANGE Local Climate Report is a new supplemental report that contains more specific outdoor reference information for your area. We want you to see this new report so you can decide if it would be a useful tool for your investigations. Eurofins EMLab P&K is the only laboratory that equips you with scientifically-developed and statistically accurate tools like this new report for your mold investigations.

What does this report tell me?

Since the climate and outside spore distribution across even a single state may vary depending upon your location, this report breaks data from states with similar climates into smaller groupings (called EMLab Regional Climate codes) based upon climate data from the NOAA National Climactic Data Center. The spore type data comes from Eurofins EMLab P&K's unparalleled database of over 350,000 spore trap samples. We evaluated each grouping and displayed the typical frequency and counts of a given spore type within that EMLab Regional Climate code. This gives you a point of reference for the number and types of spores usually present in the outdoor air in your area across the month of sampling and the entire year.

What is the cost of this new report?

There is none. MoldRANGE Local Climate is offered as free supplement to Eurofins EMLab P&K clients.

What if I am happy with my existing report preferences and do not wish to receive this report in the future?

Simply contact your Project Manager or email us at EBET.customerservice@et.eurofinsus.com and let us know. We can reset your preferences so that you continue to receive your typical report formats instead.

Report for:

Mr. Scott Fountain
Ramboll US Corporation: Illinois
333 W. Wacker Drive, Suite 2700
Chicago, IL 60606

Regarding: Eurofins EPK Built Environment Testing, LLC
Project: 1690030209-001
EML ID: 3248819

Approved by:

Dates of Analysis:
Spore trap analysis: 05-03-2023

Technical Manager
Ariunaa Jalsrai

Service SOPs: Spore trap analysis (EM-MY-S-1038)
AIHA-LAP, LLC accredited service, Lab ID #103005

All samples were received in acceptable condition unless noted in the Report Comments portion in the body of the report. Due to the nature of the analyses performed, field blank correction of results is not applied. The results relate only to the samples as received and tested. Information supplied by the client which can affect the validity of results: sample air volume.

Eurofins EPK Built Environment Testing, LLC ("the Company"), a member of the Eurofins Built Environment Testing group of companies, shall have no liability to the client or the client's customer with respect to decisions or recommendations made, actions taken or courses of conduct implemented by either the client or the client's customer as a result of or based upon the Test Results. In no event shall the Company be liable to the client with respect to the Test Results except for the Company's own willful misconduct or gross negligence nor shall the Company be liable for incidental or consequential damages or lost profits or revenues to the fullest extent such liability may be disclaimed by law, even if the Company has been advised of the possibility of such damages, lost profits or lost revenues. In no event shall the Company's liability with respect to the Test Results exceed the amount paid to the Company by the client therefor.

Eurofins EPK Built Environment Testing, LLC's LabServe® reporting system includes automated fail-safes to ensure that all AIHA-LAP, LLC quality requirements are met and notifications are added to reports when any quality steps remain pending.

Date of Receipt: 05-03-2023
 Date of Report: 05-04-2023

SPORE TRAP REPORT: NON-VIABLE METHODOLOGY

Location:	050123-01: Outdoors-Woodland main Entrance			050123-02: Classroom 708		
Comments (see below)	None			A		
Lab ID-Version‡:	15748495-1			15748496-1		
Analysis Date:	05/03/2023			05/03/2023		
	raw ct.	% read	spores/m3	raw ct.	% read	spores/m3
Ascospores						
Basidiospores	3	25	240			
Botrytis						
Chaetomium						
Cladosporium						
Curvularia						
Epicoccum						
Fusarium						
Myrothecium						
Nigrospora						
Other colorless						
Penicillium/Aspergillus types†						
Pithomyces						
Rusts						
Smuts, Periconia, Myxomycetes						
Stachybotrys						
Stemphylium						
Torula						
Ulocladium						
Zygomycetes						
Background debris (1-4+)††	< 1+			1+		
Hyphal fragments/m3	20			20		
Pollen/m3	< 20			< 20		
Skin cells (1-4+)	< 1+			1+		
Sample volume (liters)	50			50		
§ TOTAL SPORES/m3			240			< 20

Comments: A) No spores detected.

Spore types listed without a count or data entry were not detected during the course of the analysis for the respective sample, indicating a raw count of <1 spore.

† The spores of *Aspergillus* and *Penicillium* (and others such as *Acremonium*, *Paecilomyces*) are small and round with very few distinguishing characteristics. They cannot be differentiated by non-viable sampling methods. Also, some species with very small spores are easily missed, and may be undercounted.

††Background debris indicates the amount of non-biological particulate matter present on the trace (dust in the air) and the resulting visibility for the analyst. It is rated from 1+ (low) to 4+ (high). Counts from areas with 4+ background debris should be regarded as minimal counts and may be higher than reported. It is important to account for samples volumes when evaluating dust levels.

The analytical sensitivity is the spores/m³ divided by the raw count, expressed in spores/m³, per spore and per sample.

For more information regarding analytical sensitivity, please contact QA by calling the laboratory.

‡ A "Version" indicated by -"x" after the Lab ID# with a value greater than 1 indicates a sample with amended data. The revision number is reflected by the value of "x".

§ Total Spores/m³ has been rounded to two significant figures to reflect analytical precision.

Background debris (1-4+)††	2+			1+		
Hyphal fragments/m3	20			< 20		
Pollen/m3	20			< 20		
Skin cells (1-4+)	2+			1+		
Sample volume (liters)	50			50		
§ TOTAL SPORES/m3			240			< 20

Comments: A) No spores detected.

Spore types listed without a count or data entry were not detected during the course of the analysis for the respective sample, indicating a raw count of <1 spore.

† The spores of *Aspergillus* and *Penicillium* (and others such as *Acremonium*, *Paecilomyces*) are small and round with very few distinguishing characteristics. They cannot be differentiated by non-viable sampling methods. Also, some species with very small spores are easily missed, and may be undercounted.

††Background debris indicates the amount of non-biological particulate matter present on the trace (dust in the air) and the resulting visibility for the analyst. It is rated from 1+ (low) to 4+ (high). Counts from areas with 4+ background debris should be regarded as minimal counts and may be higher than reported. It is important to account for samples volumes when evaluating dust levels.

The analytical sensitivity is the spores/m³ divided by the raw count, expressed in spores/m³, per spore and per sample.

For more information regarding analytical sensitivity, please contact QA by calling the laboratory.

‡ A "Version" indicated by -"x" after the Lab ID# with a value greater than 1 indicates a sample with amended data. The revision number is reflected by the value of "x".

§ Total Spores/m³ has been rounded to two significant figures to reflect analytical precision.

§ TOTAL SPORES/m3	240												

†The 'Typical Outdoor Data' represents the typical outdoor spore levels for the location and time frame indicated. The last column represents the frequency of occurrence. The very low, low, med, high, and very high values represent the 10, 20, 50, 80, and 90 percentile values of the spore type when it is detected. For example, if the frequency of occurrence is 63% and the low value is 53, it would mean that the given spore type is detected 63% of the time and, when detected, 20% of the time it is present in levels above the detection limit and below 53 spores/m3. These values are updated periodically, and if enough data is not available to make a statistically meaningful assessment, it is indicated with a dash.

§ Total Spores/m3 has been rounded to two significant figures to reflect analytical precision.

* The spores in this category are generally capable of growing on wet building materials in addition to growing outdoors. Building related growth is dependent upon the fungal type, moisture level, type of material, and other factors. *Cladosporium* is one of the predominant spore types worldwide and is frequently present in high numbers. *Penicillium/Aspergillus* species colonize both outdoor and indoor wet surfaces rapidly and are very easily dispersed. Other genera are usually present in lesser numbers.

** These fungi are generally not found growing on wet building materials. For example, the rusts and smuts are obligate plant pathogens. However, in each group there are notable exceptions. For example, agents of wood decay are members of the basidiomycetes and high counts of a single morphological type of basidiospore on an inside sample should be considered significant.

‡n = number of samples used to calculate data.

Interpretation of the data contained in this report is left to the client or the persons who conducted the field work. This report is provided for informational and comparative purposes only and should not be relied upon for any other purpose. "Typical outdoor data" are based on the results of the analysis of samples delivered to and analyzed by Eurofins EMLab P&K and assumptions regarding the origins of those samples. Sampling techniques, contaminants infecting samples, unrepresentative samples and other similar or dissimilar factors may affect these results. In addition, Eurofins EMLab P&K may not have received and tested a representative number of samples for every region or time period. Eurofins EMLab P&K hereby disclaims any liability for any and all direct, indirect, punitive, incidental, special or consequential damages arising out of the use or interpretation of the data contained in, or any actions taken or omitted in reliance upon, this report.

Smuts, Periconia, Myxomycetes	-	10	13	27	67	130	46	13	13	40	120	210	51
§ TOTAL SPORES/m3	1,400												

†The 'Typical Outdoor Data' represents the typical outdoor spore levels for the location and time frame indicated. The last column represents the frequency of occurrence. The very low, low, med, high, and very high values represent the 10, 20, 50, 80, and 90 percentile values of the spore type when it is detected. For example, if the frequency of occurrence is 63% and the low value is 53, it would mean that the given spore type is detected 63% of the time and, when detected, 20% of the time it is present in levels above the detection limit and below 53 spores/m3. These values are updated periodically, and if enough data is not available to make a statistically meaningful assessment, it is indicated with a dash.

§ Total Spores/m3 has been rounded to two significant figures to reflect analytical precision.

* The spores in this category are generally capable of growing on wet building materials in addition to growing outdoors. Building related growth is dependent upon the fungal type, moisture level, type of material, and other factors. *Cladosporium* is one of the predominant spore types worldwide and is frequently present in high numbers. *Penicillium/Aspergillus* species colonize both outdoor and indoor wet surfaces rapidly and are very easily dispersed. Other genera are usually present in lesser numbers.

** These fungi are generally not found growing on wet building materials. For example, the rusts and smuts are obligate plant pathogens. However, in each group there are notable exceptions. For example, agents of wood decay are members of the basidiomycetes and high counts of a single morphological type of basidiospore on an inside sample should be considered significant.

‡n = number of samples used to calculate data.

Interpretation of the data contained in this report is left to the client or the persons who conducted the field work. This report is provided for informational and comparative purposes only and should not be relied upon for any other purpose. "Typical outdoor data" are based on the results of the analysis of samples delivered to and analyzed by Eurofins EMLab P&K and assumptions regarding the origins of those samples. Sampling techniques, contaminants infecting samples, unrepresentative samples and other similar or dissimilar factors may affect these results. In addition, Eurofins EMLab P&K may not have received and tested a representative number of samples for every region or time period. Eurofins EMLab P&K hereby disclaims any liability for any and all direct, indirect, punitive, incidental, special or consequential damages arising out of the use or interpretation of the data contained in, or any actions taken or omitted in reliance upon, this report.

CERTIFICATE OF CALIBRATION

Certificate No. : UNTL/04270/22

Calibrated Date: 09-01-2022

Customer Name & Address	: Ramboll 333 West Wacker Drive Suite. 2700 Chicago, IL 60606	Date of Issue	: 09-01-2022
Received Date	: 08-30-2022	Type	: 00 Multi-Functional Devices
Calibration Due on (As requested by the customer)	: 09-01-2023	Manufacturer	: TSI
Location	: At Lab	Model Number	: 7575-X
Data Type	: As Left	Serial Number	: 7575X1231009

Work Procedure: 0000h: Multi-Functional

Reference Equipment(s) used:

Equipment Name	Serial No.	Traceability	Certificate No.	Calibration Due Date
Digital Barometer	192028609		1694796	04-19-2023

Traceability Statement:

CIH Equipment Company Inc. certifies that the instrument listed above meets or exceeds manufacturing tolerance limits as stated in the referenced test procedure (unless otherwise noted). This instrument has been calibrated using standards with accuracies traceable to the National Institute of Standards and Technology. CIH Equipment Company Inc. calibration system is A2LA accredited to ISO/IEC 17025-2017, ANSI/NC SL Z540-1-1994. This report may not be reproduced, except in full, without the written approval CIH Equipment Company Inc. This calibration was done by comparing the unit under test to the listed calibration standards, there was no sampling used in this calibration. The result reported herein apply only to the calibration of the items described above and no limitations of use apply to the calibration unit. A PASS (in tolerance) or FAIL (out of tolerance) result indicates all measured values fall within or outside unmodified limits. The statement of compliance does not take the reported measurement uncertainty into account. In addition, reported uncertainties do not include instabilities due to transportation, usage, passage of time etc.
